

When Things Get Rough You Need New Stuff

William Lipps
Analytical & Measuring Instrument Division
July, 2015

DON'T BE
AFRAID OF CHANGE.

A microscopic image showing several rod-shaped bacteria, likely Bacillus subtilis, stained with a blue dye. The bacteria are scattered across the field of view, with some appearing in pairs and others individually. They have a distinct cylindrical shape with rounded ends. The background is a dark, textured surface.

It's out there

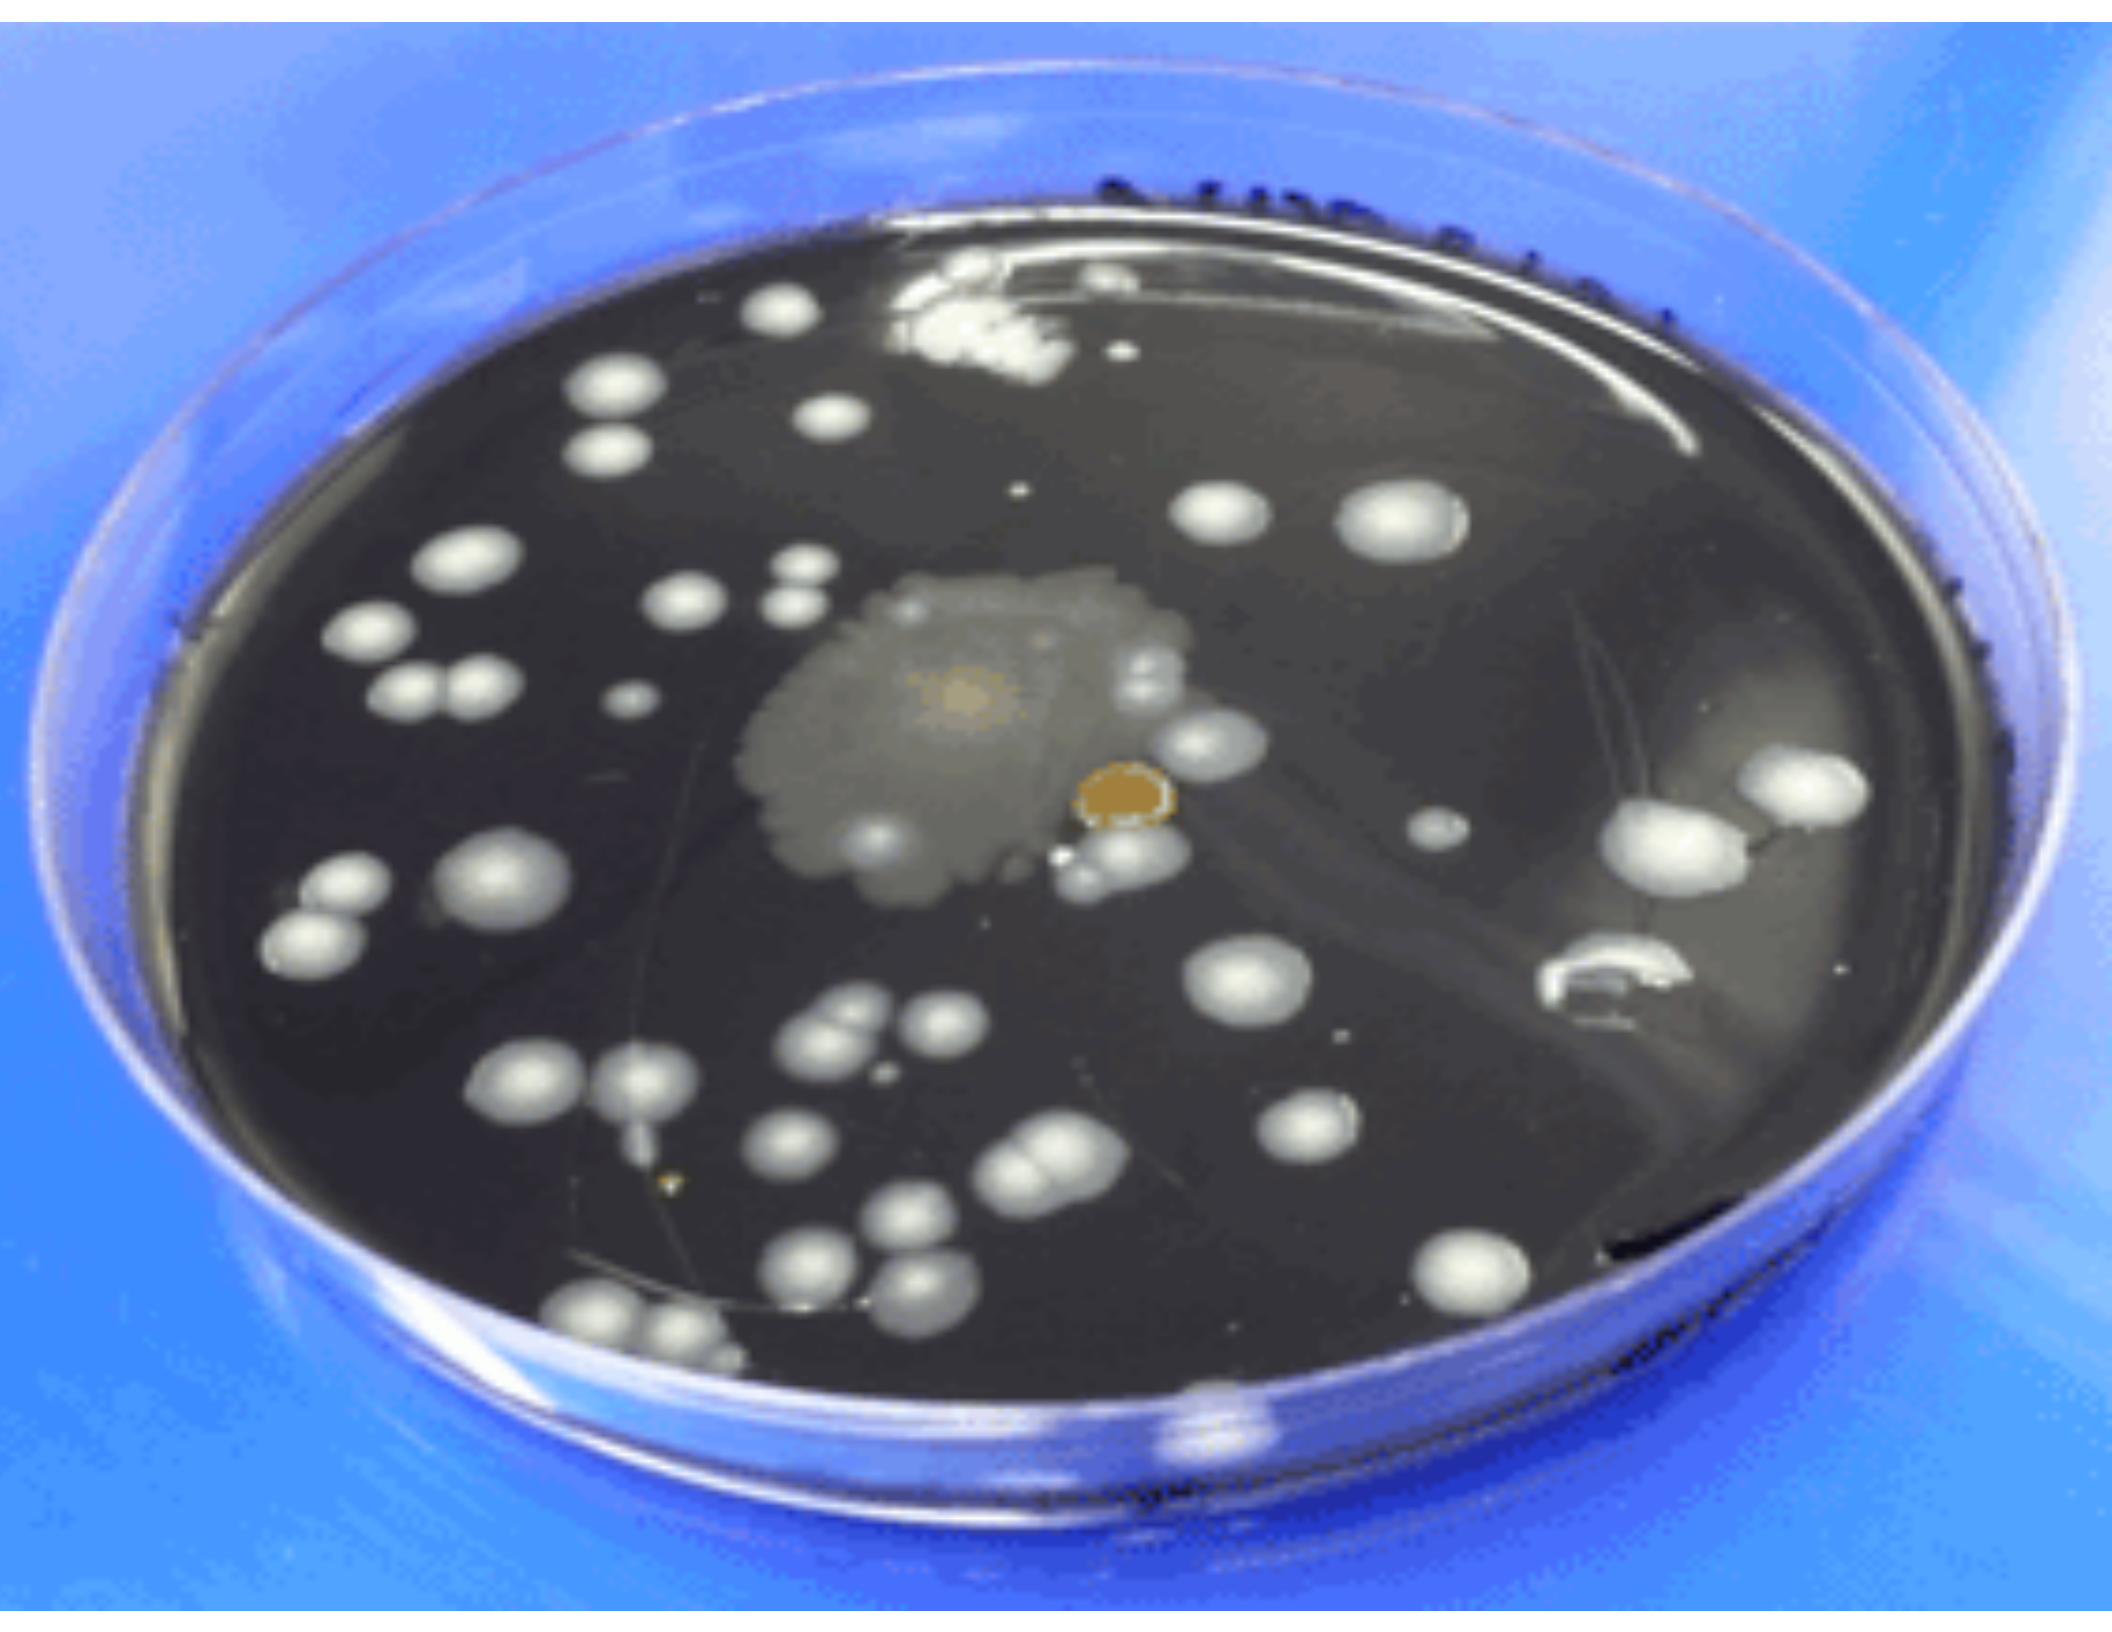

**It's coming
to get you**

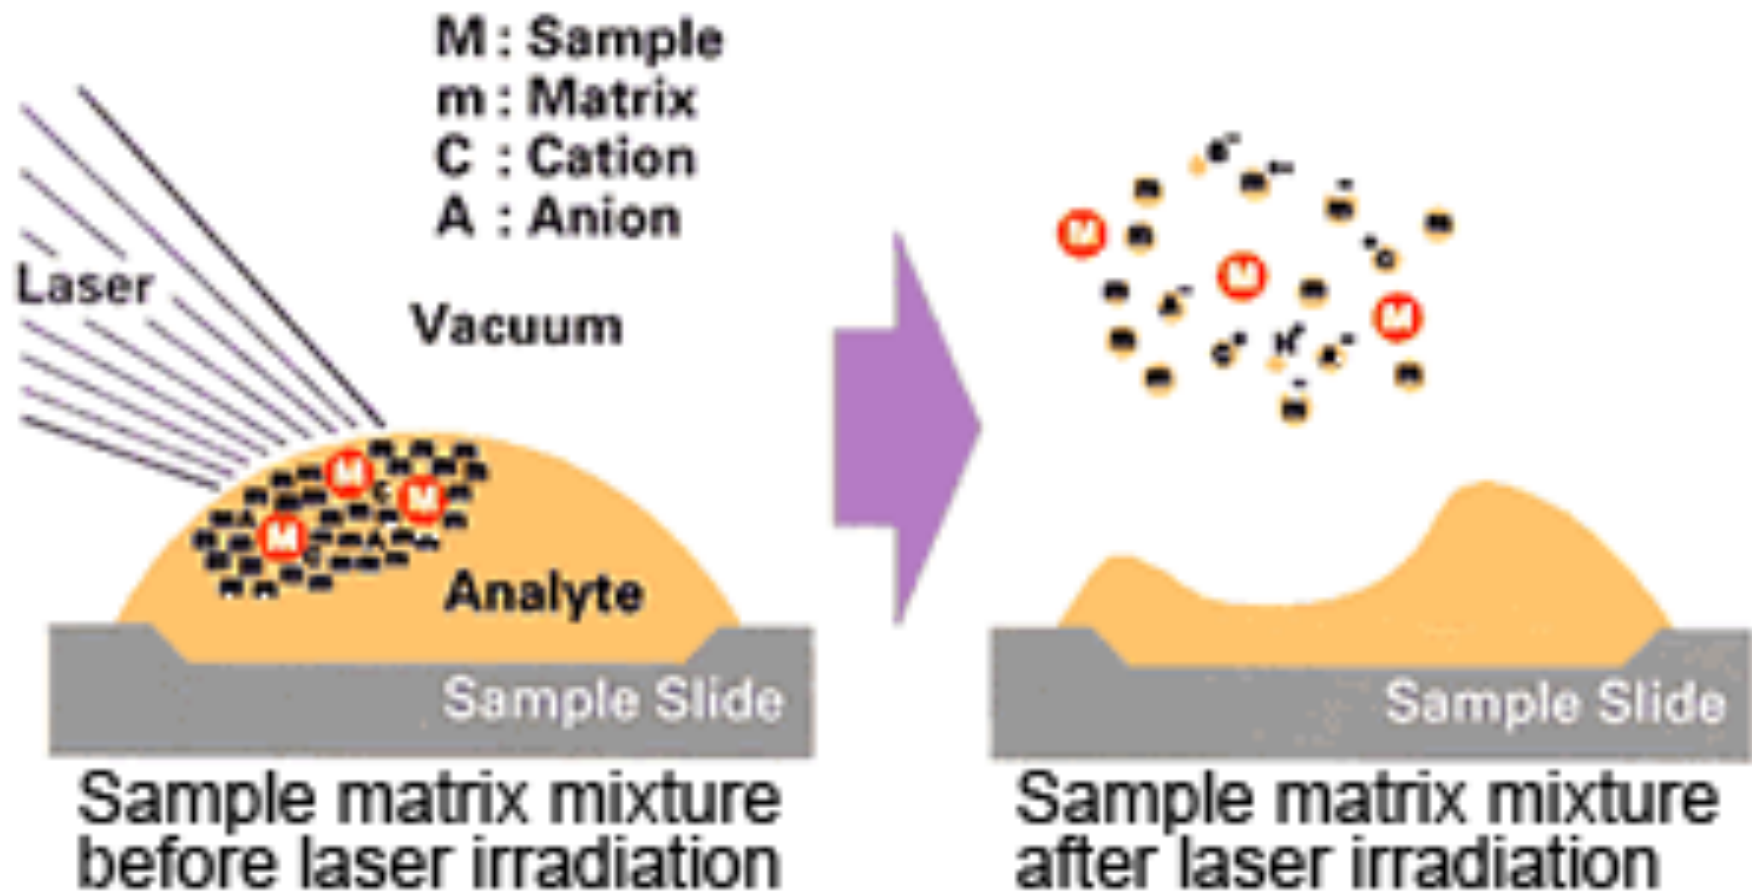

Are you ready?

How will you detect it, and are your methods fast enough?

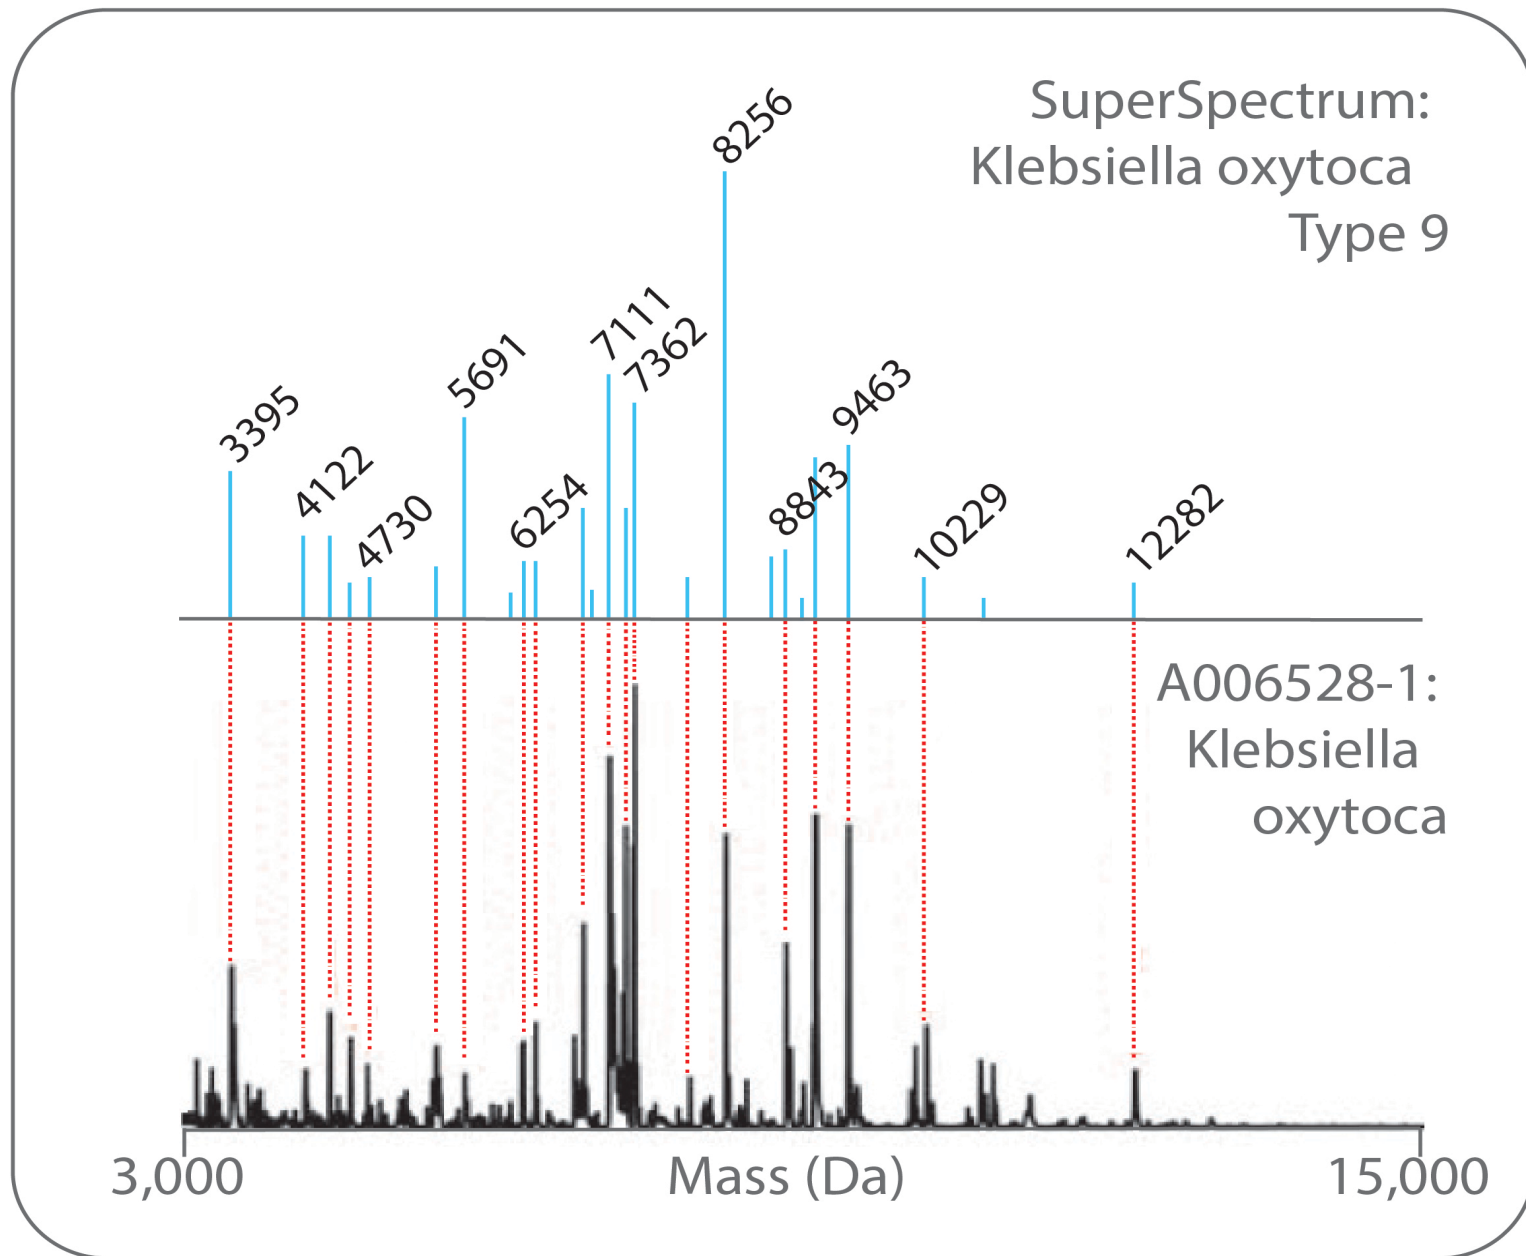

MALDI-TOF Mass Spectrometry can identify sub-species in under 2 minutes

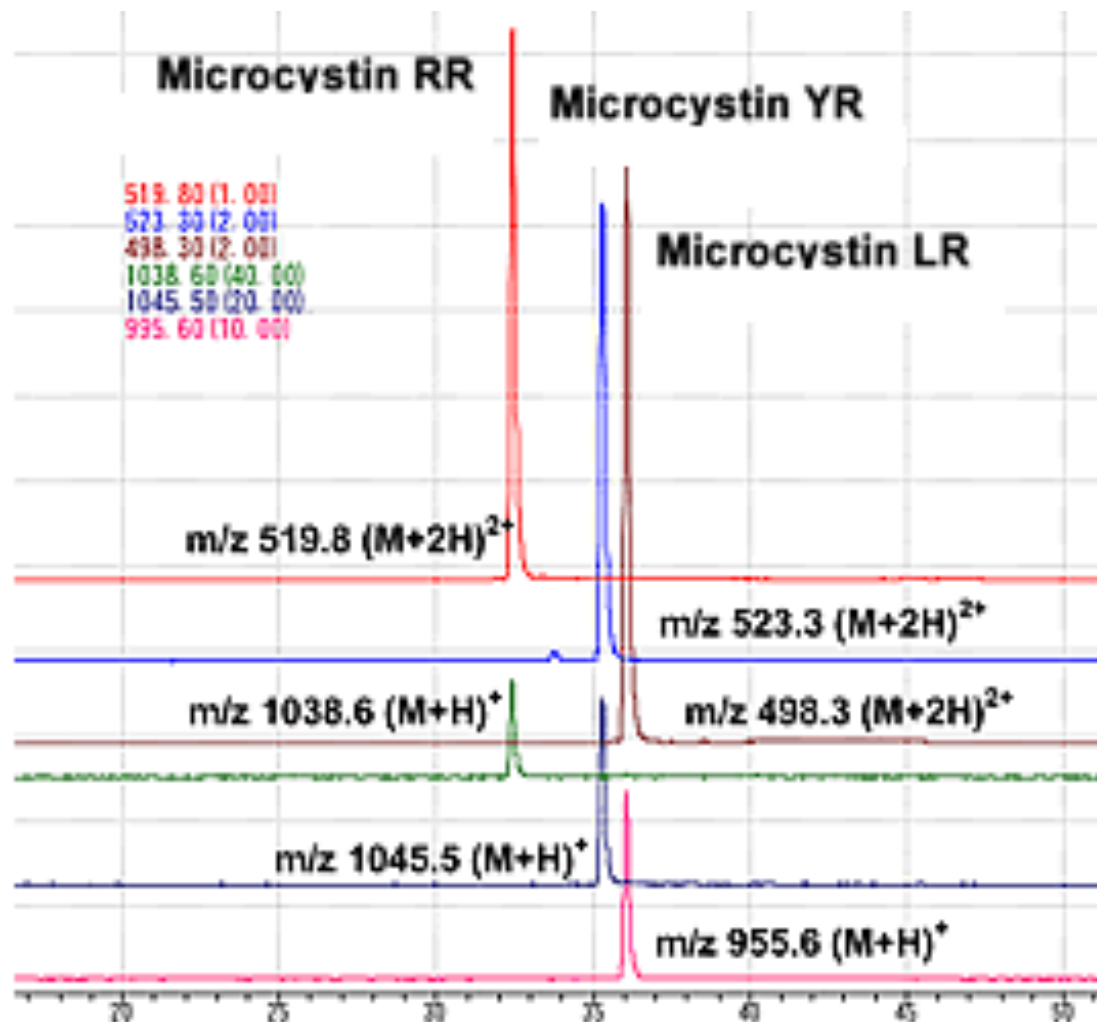

Red lines indicating a spectrum match

Algae is toxic and it Kills

LCMSMS Analysis of Microcystins

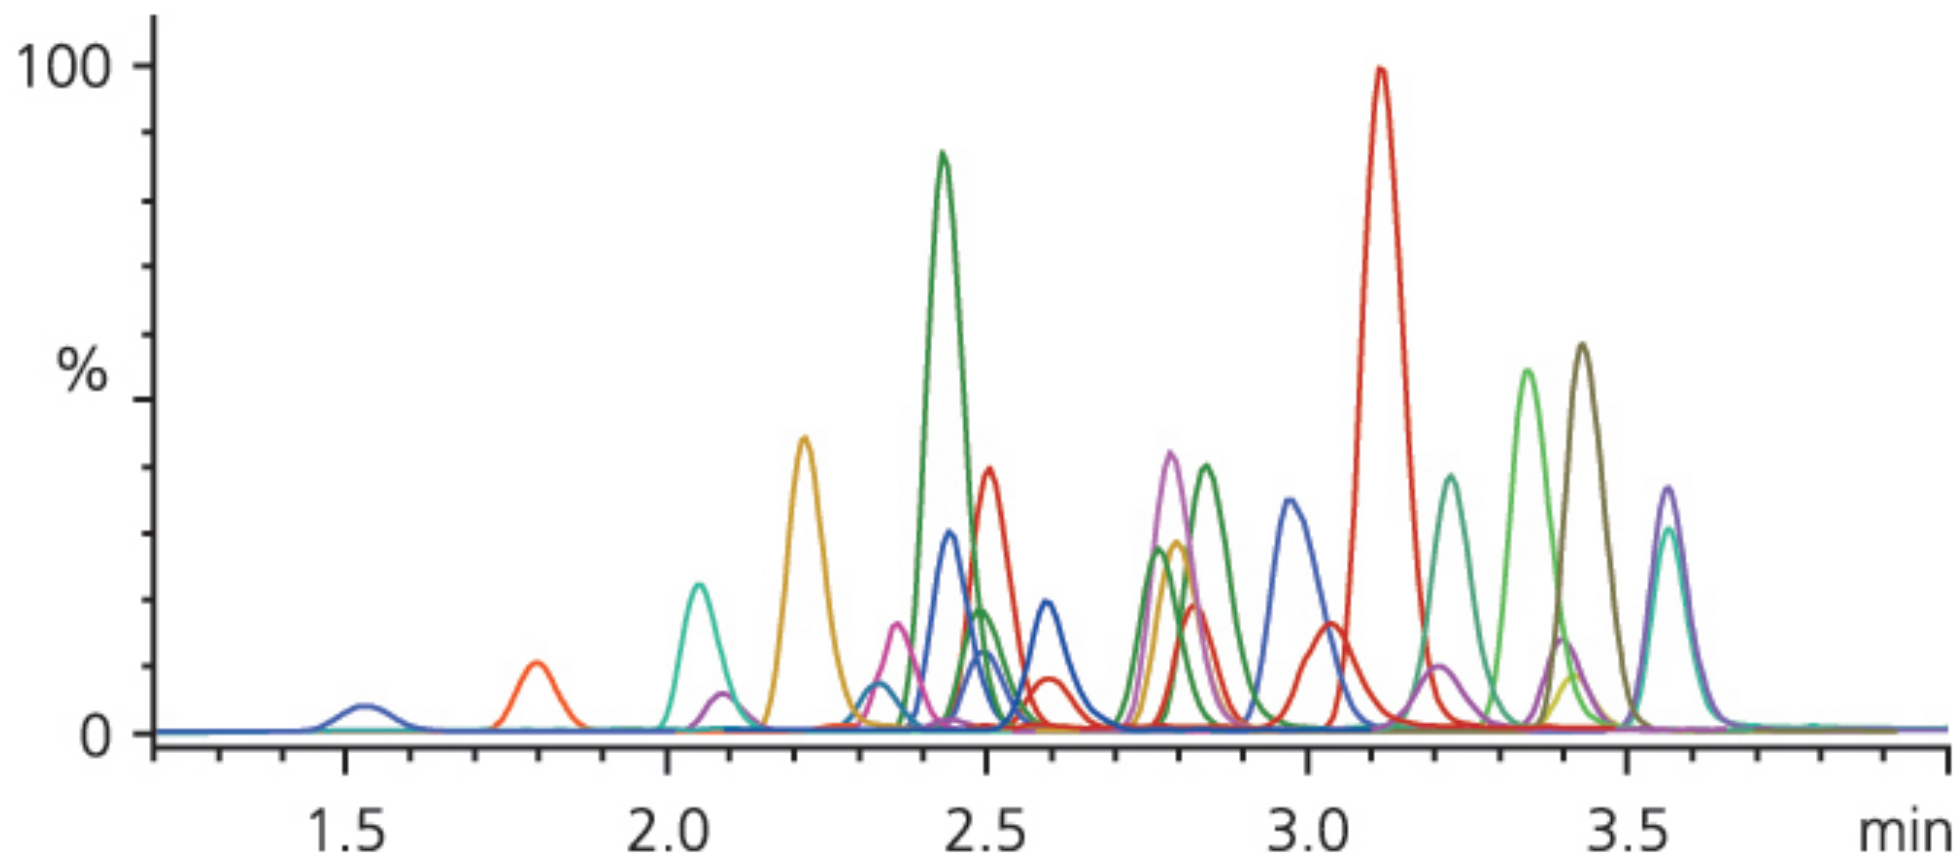

Analysis of Algal Bloom

Polar pesticides and herbicides are difficult by GC

Analyze pesticides and herbicides by LCMSMS, with very little sample prep

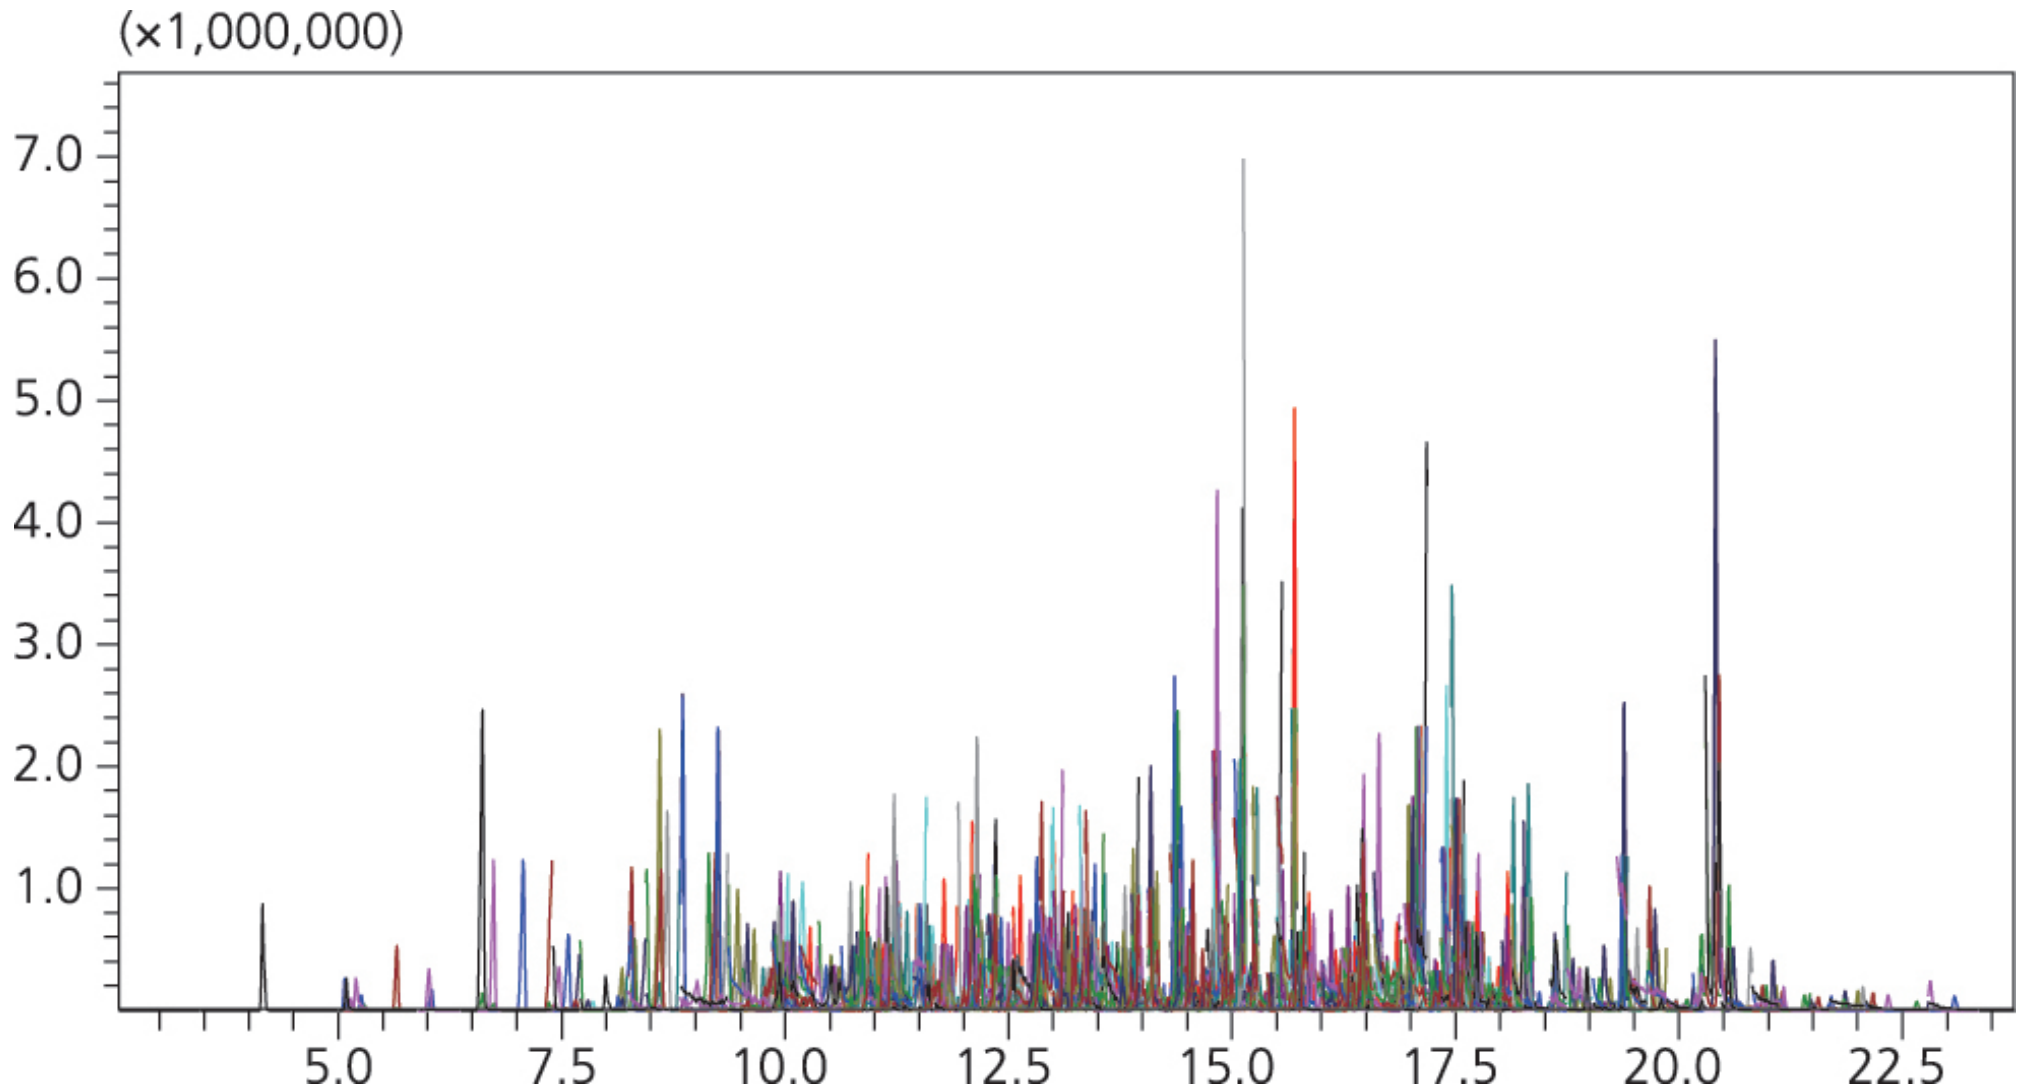

Analyze pesticides and herbicides by LCMSMS, with very little sample prep

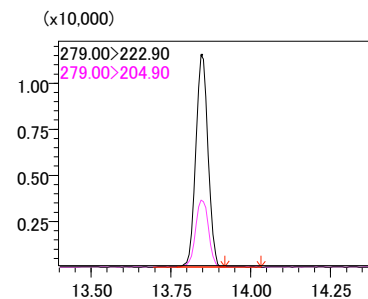

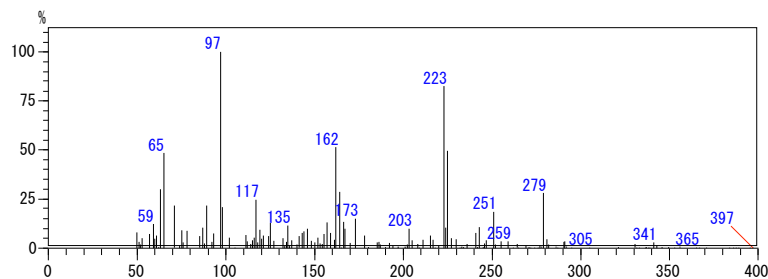

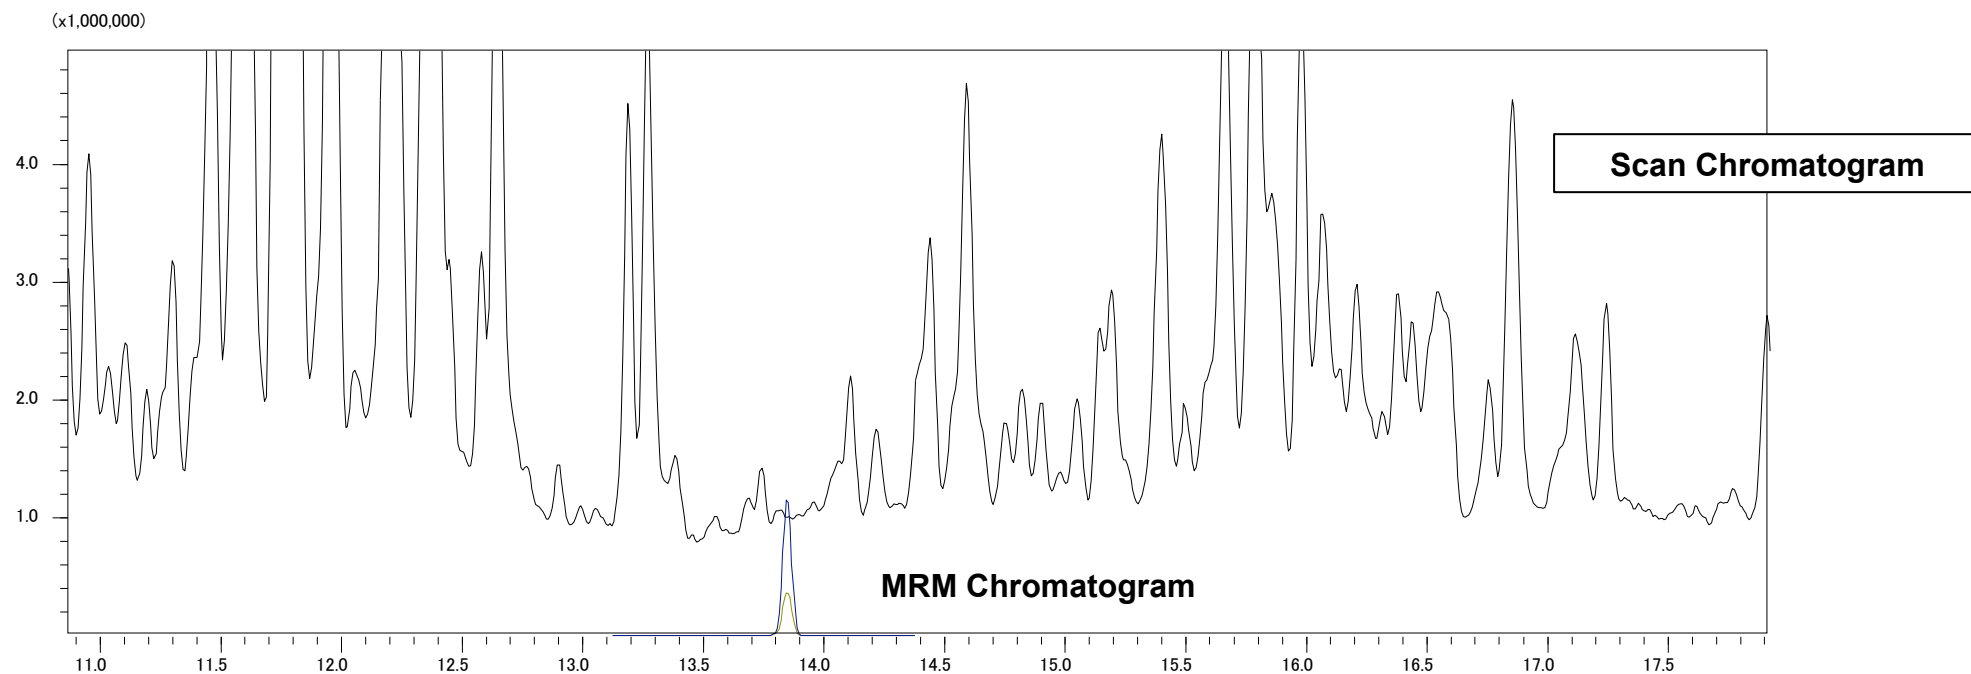

No	Compound	LOQ pg/mL	1/100 of target pg/mL*	No	Compound	LOQ pg/mL	1/100 of target pg/mL*
1	Thiuram	2.0	200	16	MPP oxon sulfoxide	4.2	10
2	Bentazone	3.9	2000	17	MPP oxon sulfone	5.7	10
3	Carbofuran	1.6	50	18	Dymron	0.65	8000
4	2,4-D	46.7	300	19	Methomyl	2.3	300
5	Triclopyr	45.3	60	20	Probenazole	5.2	500
6	Iprodione	1.7	3000	21	Diuron (DCMU)	0.7	200
7	Asulam	2.3	2000	22	Bensulfuron-methyl	4.4	4000
8	Bensulide	4.8	1000	23	Tricyclazole	2.7	800
9	Mecoprop (MCPP)	6.1	50	24	Azoxystrobin	2.7	5000
10	Carbaryl (NAC)	2.3	500	25	Halosulfuron-methyl	0.52	3000
11	Carpropamid	1.3	400	26	Flazasulfuron	0.47	300
12	Fenthion (MPP)	3.1	10	27	Thiodicarb	3.4	800
13	MPP sulfoxide	1.7	10	28	Siduron	0.82	3000
14	MPP sulfone	5.1	10	29	Fipronil	4.7	5
15	MPP oxon	4.9	10				

*Note: Official analytical methods require detection to 1/100th of regulatory targets.

We can analyze hundreds more pesticides with high selectivity and sensitivity by GCMSMS

Methods can retain full scan capability and add MRM for greater selectivity and sensitivity

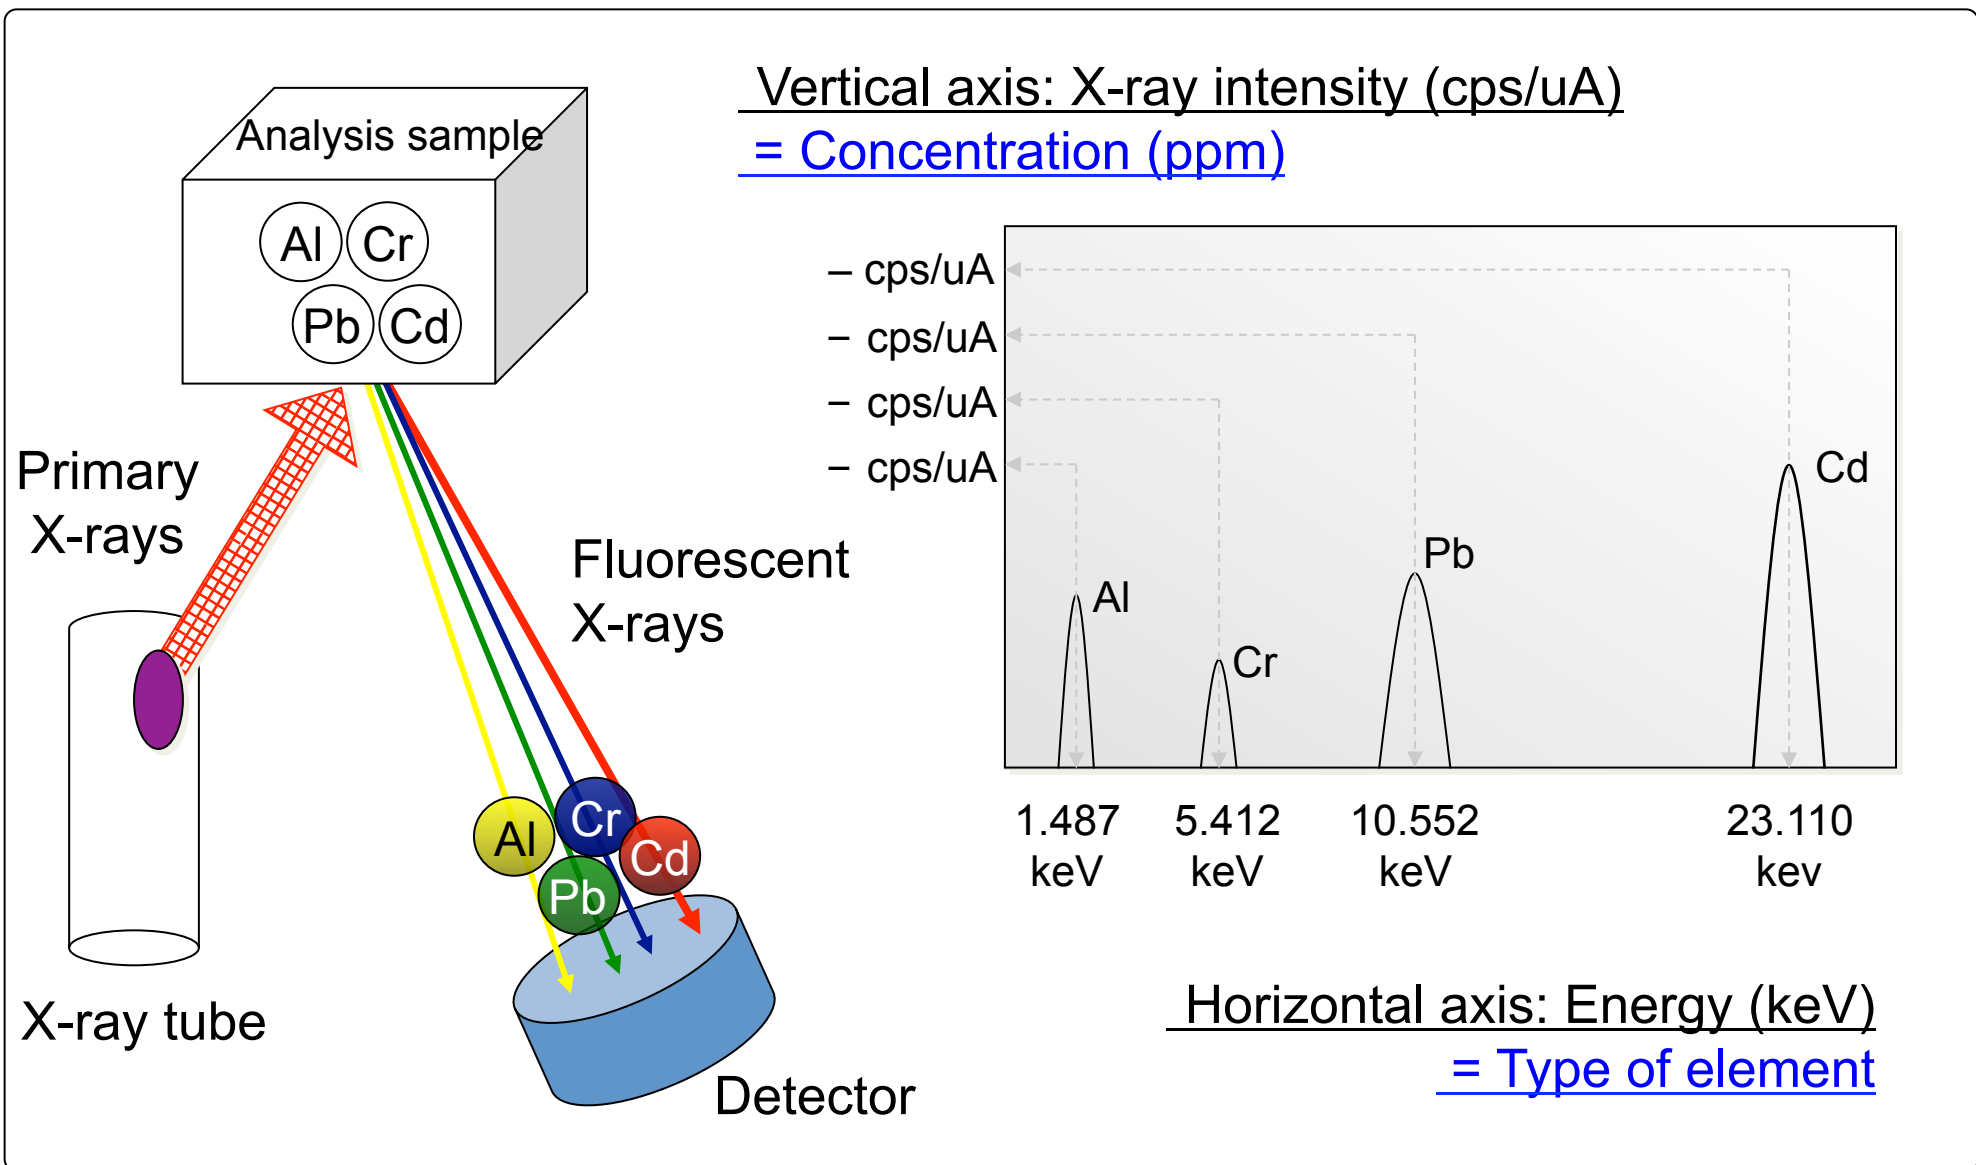

Analysis of solid waste for metals requires acid digestion and instrumental analysis,

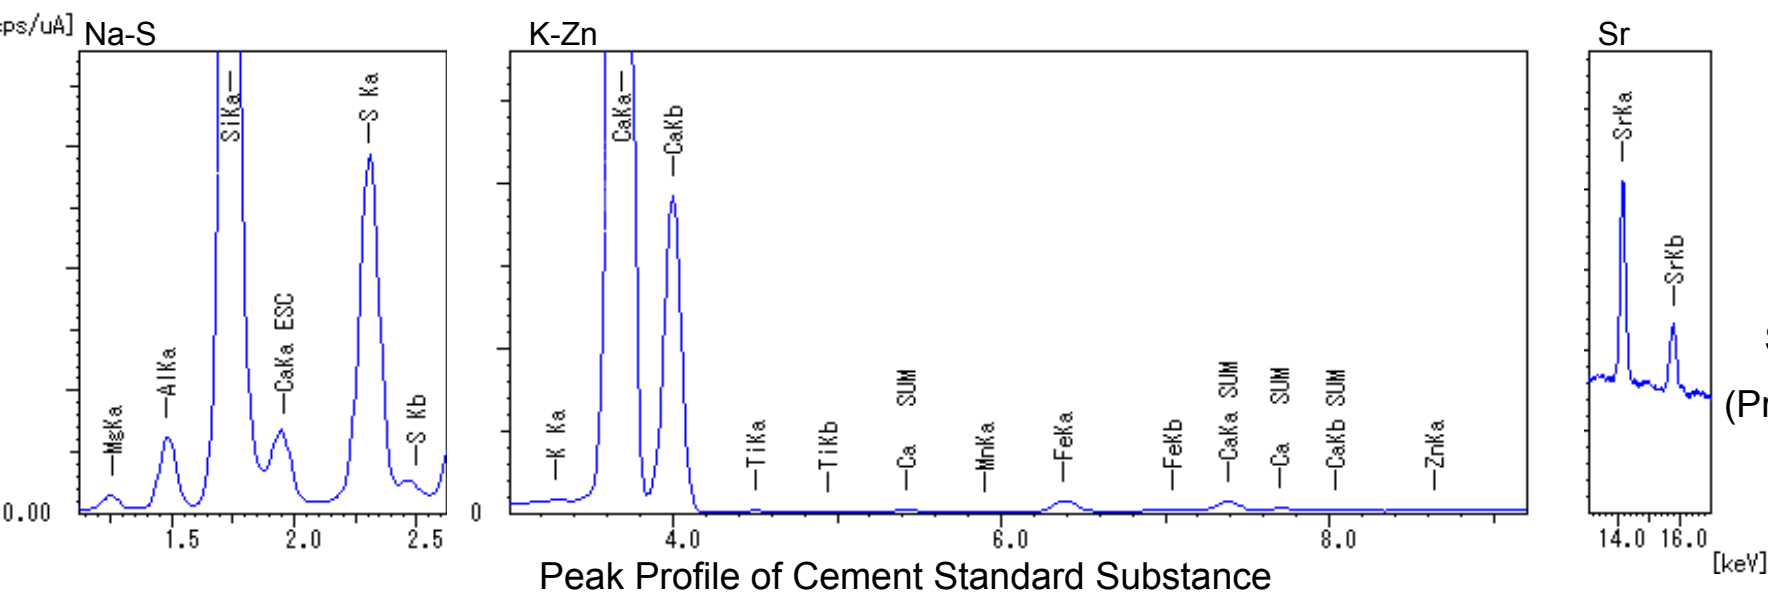

Or,

And create new methods that use XRF

An example of a whole rock quantitative analysis of cement

Sample Appearance
(Press-formed at 250 kN for 30 sec)

	% MgO	% Al ₂ O ₃	% SO ₃	% CaO
XRF	1.75	3.95	21.9	69.6
CRM	1.93	3.88	22.4	67.9

Just place liquids, slurry samples, and emulsions in a sample cell

**Sample cell,
film, and 5 mL
oil**

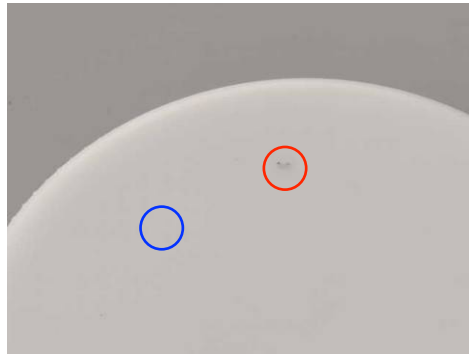

Elements in Waste Oil (0, 10, 30, and 50 ppm of each element)

Overlaid Profiles of Heavy Elements in Waste Oil

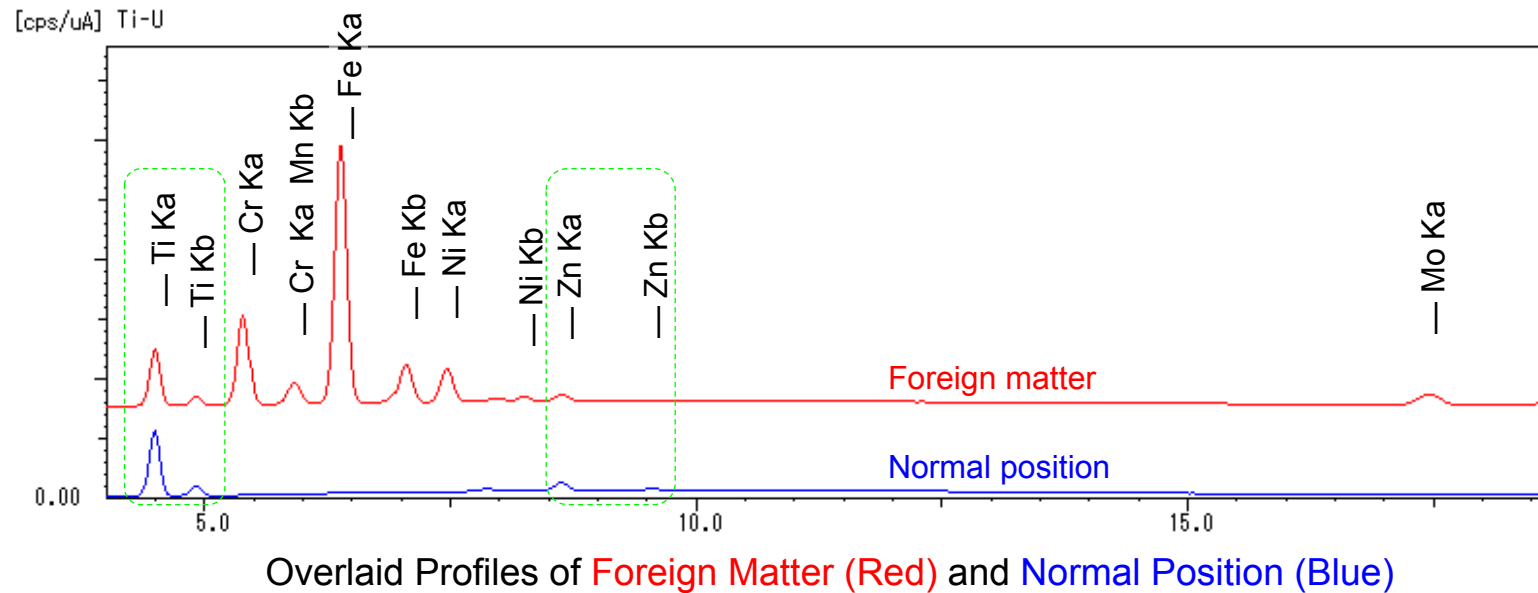

Blank Sample 10 ppm 30 ppm 50 ppm

Foreign Matter Adhering to a Plastic Extruded Part

Sample Appearance

Red circle: Foreign matter
Blue circle: Normal position

Analyte	Result	
Fe	68.287	%
Cr	16.166	%
Ni	11.424	%
Mo	2.505	%
Mn	1.619	%

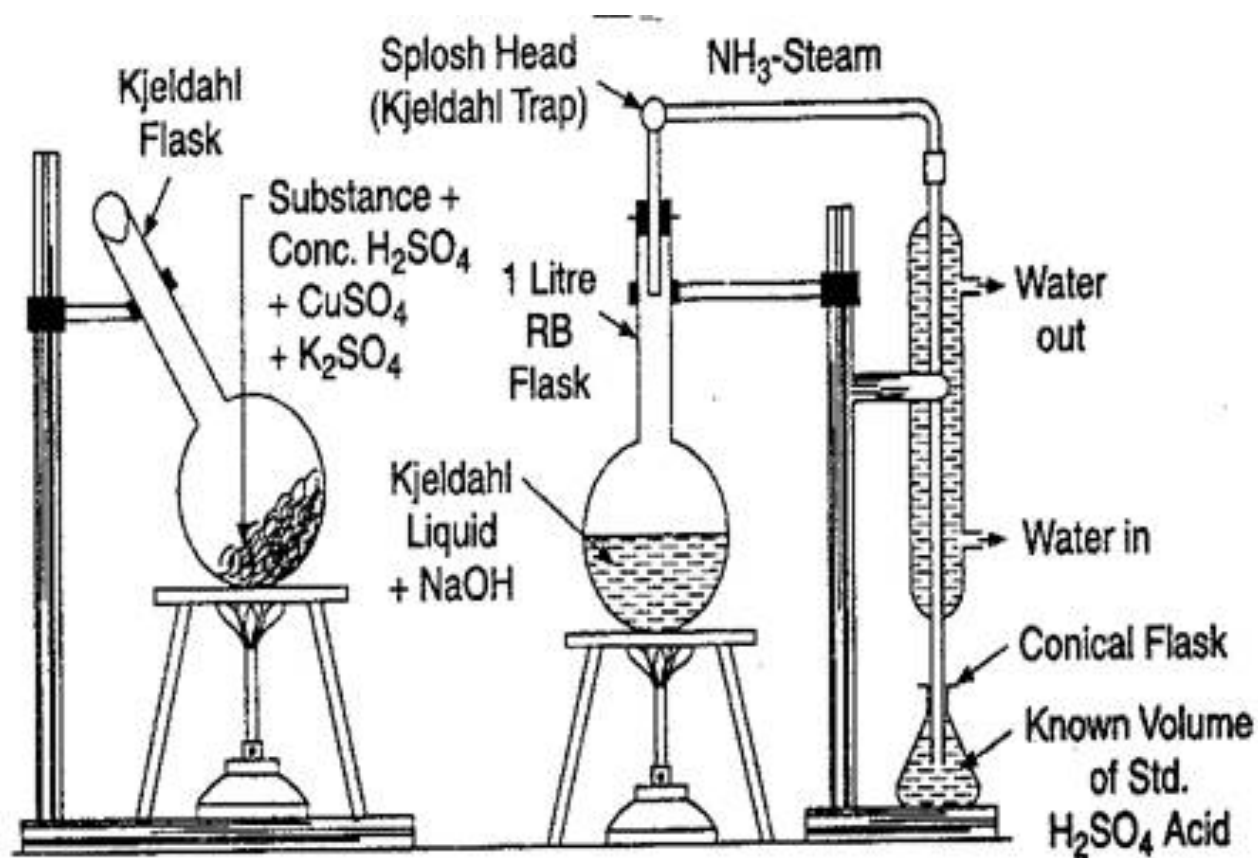

A photograph of a pond with many dead fish floating on the surface and one dead fish lying on the bottom near some green reeds.

Let's reduce toxic chemicals

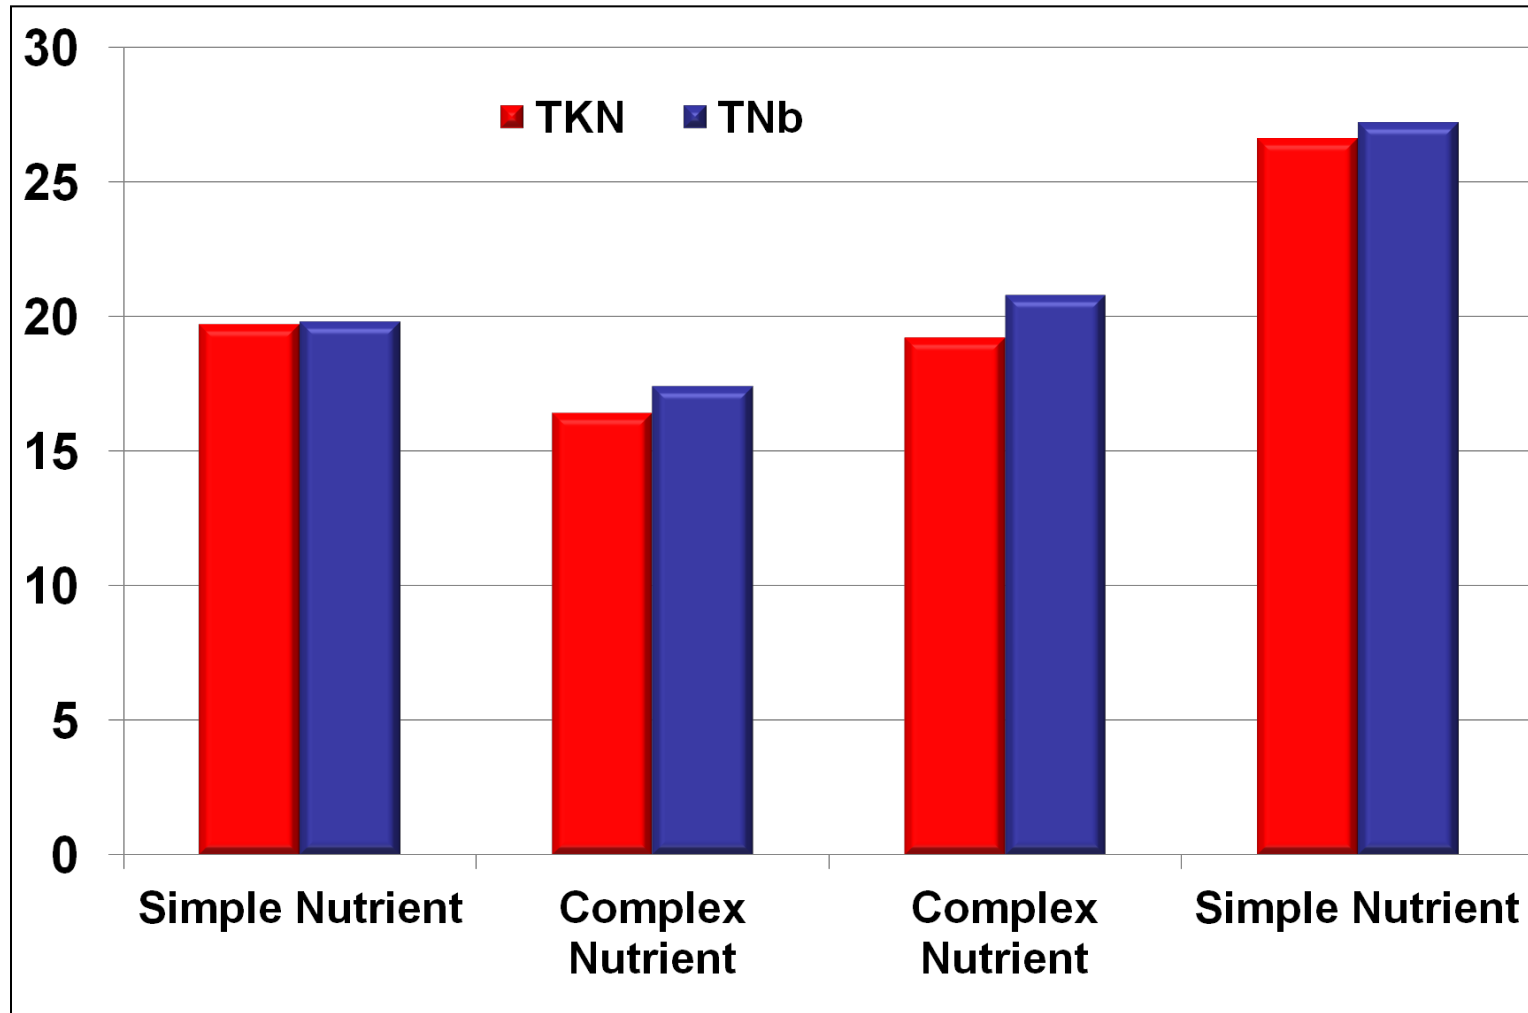

Replace toxic cadmium with reductase for NOx

Sample #	Commercial Laboratory Results, Analysis Method EPA 335.2 (mg NO ₃ +NO ₂ -N/L)	Analysis by Reductase (mg NO ₃ +NO ₂ -N/L)
1	0.8	0.94
2	<0.1	0.05
3	<0.1	0.24
4	0.66	0.68
5	11.8	11.6
6	0.78	0.79
7	2.4	3.11

Should we continue with the Kjeldahl Method for TKN?

Or use HTCO methods and obtain near equal results with TKN

**Technology is advancing faster than
the methods**

It's time for some new stuff

- **MALDI TOF – New, faster way to confirm bacteria**
- **LCMSMS – Emerging Contaminants not visible before**
- **GCMSMS – more sensitive, higher throughput**
- **XRF – no digestions, higher throughput**
- **NOx – safer, non toxic reagents**
- **TN – safer and higher throughput than TKN**

Thank You, for more information contact me
