 U.S. Environmental Protection Agency

1

DMC and the USEPA CLP

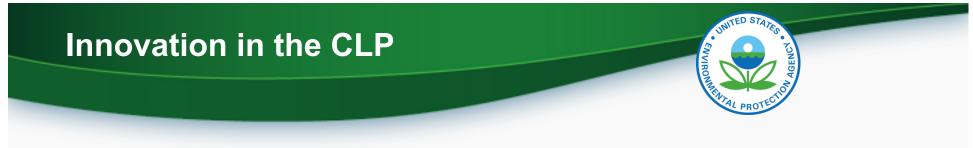

Purpose

- To demonstrate that (DMCs) should replace matrix spikes across EPA.
 - ✓ We have the means of obtaining all the information that the MS and MSD offer and more, with accuracy and precision data that are more statistically robust, more representative of the chemistry of all analytes, and less subject to interferences than the MS/MSD. Yet the historical attachment to MS/MSD data keeps them as a part of project planning in some EPA Regions and several states.
- Discussion Topics
 - ✓ CLP Overview, Benefits, Quality Assurance, and Innovation
 - \checkmark DMC Development in the CLP
 - ✓ Initial DMC Studies
 - ✓ DMC and Matrix Spike Compound Correlation Studies
 - ✓ DMC and MSC Precision Studies

USEPA Contract Laboratory Program

USEPA Contract Laboratory Program (CLP)

- Overview
 - High volume, cost effective analytical services
 - Managed by EPA with experienced contractor support
 - Detailed SOWs and thorough documentation of data quality
 - Scalable operations, automated scheduling and invoicing,
 - Flexible products from enhanced EXES
 - Headquarters funding
 - Laboratories qualified through acquisition process
 - Comprehensive QA program

- Innovative analytical and data management initiatives by CLP and OSRTI:
 - ✓ Statements of Work (SOWs)
 - ✓ Uniform data and QC reporting forms
 - ✓ Comprehensive QA program
 - \checkmark National Functional Guidelines for Data Review and Validation
 - ✓ Staged Electronic Data Deliverables SEDD
 - ✓ Environmental Data Management System (SCRIBE)
 - \checkmark On-line sample management tools in CLPSS
 - ✓ Deuterated Monitoring Compounds

- MS/MSD intended to measure method <u>accuracy</u> and <u>precision</u>.
- MS/MSD assumed to represent SDG
- No guarantee that original sample, MS, and MSD are homogenous, and in fact they often are not.
- MS/MSD samples results interpreted inconsistently, ranging from no qualification to qualifying entire project.
- Over \$200,000 per year cost to the CLP for analysis and reporting.
- MS/MSD currently an option for CLP customers (not a default).
 - What we need is an indicator of accuracy and precision for all samples in the SDG, and that requires a broadly applicable indicator of chemical similarity, and more data so we don't have to rely solely on the homogeneity of the MS and MSD samples.

- Started in 1996 with Mike Wilson of the AOC tasking EPA's Quality Assurance Technical Support (QATS) contractor to propose DMCs for the GC/MS SOWs.
 - Hypothesis:
 - Typically elute on the GC column just prior to native target analytes, and present higher quantitation masses based on the degree of deuteration.
 - Are not naturally found in environmental samples, whereas some of the MSCs or SCs could be present.
 - Significant cost savings.

- The DMCs were proposed and selected based on:
 - ✓ Cost and availability
 - > All suppliers of DMCs were researched.
 - > All levels of deuteration for each target analyte were investigated.
 - Stability and/or potential for deuterium/hydrogen exchange was evaluated.
 - Costs of DMC solutions and/or neat DMC compounds from all potential sources were assessed.
 - ✓ Representativeness of chemical classifications of target analytes
 - > VOC target analytes were classified into 5 chemical groups.
 - SVOC target analytes were classified into 16 chemical groups.
 - Selected VOC DMCs represent all 5 VOC chemical groups.
 - Selected SVOC DMCs represent 13 of 16 SVOC chemical groups, with no DMC available, or was cost-prohibitive for remaining 3 groups.

- The DMCs were proposed and selected based on:
 - ✓ Toxicity
 - When possible, toxicity of the DMCs was considered, with the higher toxicity compounds preferred. Deviation from this approach occurred for prohibitive cost, non-availability, or when more performance data were available for lower toxicity DMCs.
 - DMC performance based on native compound accuracy and precision characteristics
 - Analyte performance of DMCs was assumed to closely mimic the analytical behavior of the associated target compounds.
 - Cost estimate of a revised QC system versus continued use of SMCs and SCs
 - Preparing DMC spiking solutions from neat compounds results in a cost of pennies/VOC sample, and approximately \$1.40/SVOC sample.
 - Other costs were required to change the QC system to accommodate the use of DMCs, such as rewriting the SOW.

- In 1997, the QATS Lab was tasked to conduct single laboratory studies to evaluate the analytical behavior and ruggedness of the selected VOC and SVOC DMCs.
- VOC DMC single laboratory study analyzed initial calibration sets and spiked water sets (5-replicates) under 6 different instrument conditions to assess DMC and target analyte recovery and precision correlation, as well as ruggedness.

July 13-17, 2015

- Conclusions and recommendations from the VOC and SVOC DMC single laboratory studies:
 - ✓ DMCs provide excellent recovery and precision correlation with corresponding native target compounds, and with most of the other target analytes within a DMC group.
 - ✓ The 14 VOC and 16 SVOC DMCs provide a group of QC compounds that better represent the classes of compounds in the target analyte lists and retention time groups than using the initial SMCs and SCs.
 - ✓ Initial advisory QC Recovery Limits for the DMCs were recommended using the 90% confidence intervals calculated from a historical database of native compound recovery data.
 - ✓ A revised SOW was prepared incorporating the use of VOC and SVOC DMCs.
 - ✓ Multi-laboratory studies were recommended as the next phase in DMC development.

- Subsequent QATS Studies Conducted:
 - ✓ 1997 Interlaboratory study for CLP's Mike Wilson on DMC recovery and precision.
 - ✓ 1997 Multi-laboratory study for CLP's Ed Messer on SPE, SPME, accelerated solvent extraction, and automated soxhlet extraction.
 - ✓ 2000 Multi-laboratory study for CLP's Eric Reynolds on potential new VOC and SVOC analytes.
 - ✓ 2000 Multi-laboratory study for CLP's Terry Smith on the effects of preservation and temperature on volatile VOC samples.
 - ✓ 2002 DMC/MSC study for CLP's Terry Smith on recovery and precision, including 312 volatile MS/MSD and 116 semivolatile MS/MSD analyses.
 - ✓ 2003 Multi-laboratory study for CLP's Terry Smith on recovery and precision of DMCs in soil samples, to establish acceptance limits for soils.
 - ✓ 2008 DMC Recovery Precision and Acceptance Limit Survey for CLP's Phil Cocuzza and John Nebelsick.

- The objective of the 2002 correlation study was to evaluate the statistical correlation between the DMC recovery and associated MSC recovery to determine the continued need for MS/MSD analysis.
- DMC and MSC recoveries evaluated from 312 volatile MS/MSD analyses and 116 semivolatile MS/MSD analyses.
- Data used in this study was derived from aqueous sample analytical results from CLP laboratories.
- Six VOC DMC/MSC pairs were identified for the study.
- Nine SVOC DMC/MSC pairs were identified for the study.
- DMC recoveries were evaluated against associated MSC recoveries.

- Linear regression analysis and numerical correlation analysis was performed on each data set after pre-processing data into nine subsets:
 - Unprocessed Raw Data
 - Data Set With Outliers Removed
 - ✓ Data Set Which Lies Within 95% Confidence Intervals
 - ✓ Data Set Which Lies Within 99% Confidence Intervals
 - ✓ Data Set With DMC/MSC Recovery Differences < 10%
 - ✓ Data Set With DMC/MSC Recovery Differences < 20%
 - ✓ Data Set Which Exhibits Only a Negative DMC/MSC Correlation
 - ✓ Data Set Which Exhibits Only a Positive DMC/MSC Correlation
 - ✓ Data Set Which Demonstrates a Correlation Value r > 0.900
- DMC/MSC correlation of each data set was measured through calculation of average r-Values.

- Data was processed as subsets to offset variables in data sets due to:
 - ✓ Sample results from different sites with matrix variation.
 - ✓ Sample results from up to eight different laboratories.
 - Samples spiked with standard solutions from different sources.
 - Samples spiked with several different standard solutions (TCL standards, DMC calibration standards, DMC spiking solutions, MS/ MSD spiking standards) prepared by different individuals.
 - Samples prepared and analyzed under different conditions, facilities, and instrumentation.
- Additional statistics used to evaluate DMC/MSC recovery correlation included average % recoveries, standard deviation, and relative standard deviation.

- In 2008, under the direction of EPA's Mr. John Nebelsick and Mr. Phil Cocuzza, the QATS Laboratory conducted a DMC Recovery Precision and Acceptance Limit Evaluation Study.
- Objective of the study was to evaluate if DMC recovery accuracy and precision data can be use to replace the MS/MSD recovery and precision data.
- DMC data from 105 CLP SOM organic fraction SDGs were statistically evaluated to determine recovery accuracy and precision within an SDG.
- Recovery precision within an SDG was evaluated against a predetermined baseline of acceptable precision, adopted from the SOM SOW initial calibration precision criteria.

- STANDARD PROTECTION
- DMC statistical information evaluated within each SDG included:
 - ✓ Average percent recovery
 - ✓ Standard deviation
 - \checkmark Relative standard deviation
 - \checkmark Low and high DMC recoveries within the data set
 - \checkmark Number of DMC recoveries exceeding the established QC Limits
 - ✓ Number of data points
- If DMC recovery precision indicators within an SDG exceeded the baseline limit of acceptable precision, further processing of DMC data was performed to determine the cause of the anomalous results.
- MS/MSD recovery and precision statistics were also determined for each SDG, provided that MS/MSD analyses were performed.

- Five different organic fractions/matrices were examined from the 105 SDGs.
 - ✓ Trace concentration aqueous volatile organics (5,889 DMC data points)
 - Low/Medium Concentration Aqueous Volatile Organics (4,914 DMC data points)
 - Low/Medium Concentration Volatile Organics in Soil (4,550 DMC data points)
 - ✓ Aqueous Semivolatile Organics (3,232 DMC data points)
 - Low/Medium Concentration Semivolatile Organics in Soil (4,240 DMC data points)
- The following slides provide example data processing and narrative assessment from Trace Aqueous Volatile Organics SDG Y2F69

- SDG Y2F69 Summary
 - ✓ SDG consisted of 30 sample analyses: 16 field samples, 4 field blanks, 1 MS/MSD set, 5 method blanks, 1 storage blank, and 2 field sample dilutions.
 - ✓ There were 390 DMC data points in the SDG, with only 1 DMC recovery outlier (1,1-DCE-d₂ biased high due to native 1,1-DCE in the sample).
 - \checkmark 6 of the 10 MS/MSD results exceeded the recovery limits.
 - ✓ RSD values for all DMCs across the sample set are <20%, most <10%.
 - ✓ Most of the sample were relatively clean with no indication of matrix interference.
 - ✓ High level (outside calibration range) of trichloroethene in the sample used for MS/MSD.
 - ✓ No difference in RSD values when blanks are included in the sample set.

SDG Number Y2F69

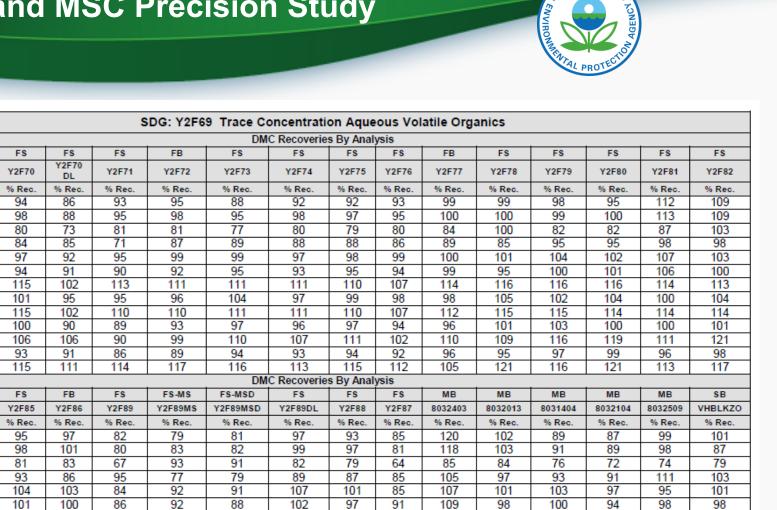

This SDG consists of thirty (30) sample analyses including sixteen (16) field samples, four (4) field blanks, an MS/MSD set, five (5) method blanks, one (1) storage blank, and two (2) field sample dilutions. The RSD values for the DMC recoveries in this sample set are all less than 20 percent (most less than 10 percent) indicating good precision. Two (2) of the field samples required dilution due to the high levels of trichloroethene reported in the original analyses. In addition to the trichloroethene detected in these samples, lower levels of additional chlorinated hydrocarbons were detected in several of the other samples. Most of the samples in this set were relatively clean with no indication of potential for matrix interference. One (1) of the 390 DMC recovery values in this sample set exceeded the current SOM01.2 QC acceptance limits. This high recovery was for 1,1-dichloroethene-d₂ in sample Y2F83 which contained a moderate amount of native 1.1-dichloroethene, contributing to a high bias result for the DMC. There are no substantial differences in the RSD values for the DMC recoveries when the blanks or the MS/MSD samples are excluded from the statistical data set. The recoveries for benzene, trichloroethene, and toluene in both the MS and MSD analyses exceeded the advisory QC limits, although the low RPD values for these compounds indicate good precision between the duplicate analyses. There was a high level of native trichloroethene in the sample used for the MS/MSD analysis, and the laboratory performed the MS/MSD analyses using a five-fold dilution of the sample.

DMC Precision Study Analytical Fraction Summary

Fraction	No. of DMC Data Points from 105 SDGs	No. DMCs Exceeding QC Limits	% of Data Set	% of SDGs with MS/ MSD	% of MS/ MSD Analytes Outside Criteria	% of RPD Results Outside Criteria
Trace Aqueous VOCs	5,889	83	1.4	42	11	2
L/M Aqueous VOC	4,634	88	1.9	52	5.5	3.6
L/M VOCs in Soil	4,550	472	10.4	45	7.3	18.2
Aqueous SVOC	3,232	108	3.3	60	9.3	0.0
SVOCs in SOil	4,224	114	2.7	65	3.4	0.9

July 13-17, 2015

DMC Development Studies Summary of Findings

- 1) DMC recoveries correlate well with MSC recoveries.
- 2) The DMCs mimic the chemistry of the native compounds,
- 3) Chemical class representation
- 4) DMCs indicate matrix effects in every sample,
- 5) Precision can be assessed across an entire SDG.
- 6) Results more statistically significant, due to the number of DMCs used,
- 7) Quantitation bias is not observed for DMCs,
- 8) Further study possible of similar matrices
- 9) Eliminating MS/MSD saves solvent and other waste, and reduces resource consumption by labs

10) Substantial cost savings for CLP program as well.
